

Interview Transcription:

Interaction of Mohd Yusuf (the Dispatcher of the logistics goods) with Yashvardhan in Hindi via Gmeet.

Yashvardhan: Hello sir, my name is Yashvardhan and I am from IIT Madras. We are doing a project on local logistics. Can I ask you a few questions regarding your work?

Mohd Yusuf (Dispatcher): Yes sir, please go on.

Yashvardhan: Can you explain to me the process of the main job assigned to you?

Dispatcher: Sir, basically my job is to assign appropriate good vehicles, drivers, labourers and necessary resources to complete logistic orders. I have to make sure that the order is delivered at the right time to the right location.

Yashvardhan: Do you ever face any problems while assigning good vehicles and labourers?

Dispatcher: Yes sir, of course. It is stressful since such things are done manually. Recently, last month, one such miscalculation happened. I had assigned 4 labourers and a small vehicle for picking up goods from a farmhouse. But the vehicle was not spacious enough to carry the load. It caused a massive 4-hour delay. Hence another vehicle had to reach the spot to load the goods.

Yashvardhan: What happens when a big order takes too much time to load or unload?

Dispatcher: Sir, some big shifting services consume 4- 5 hours. Often things which seem to happen quickly, take a lot of time. This delays the next delivery and creates frustration among the customer in the queue, the driver and myself.

Yashvardhan: What if a truck breaks down in the middle of the road due to any reason?

Dispatcher: Sir, it has happened many times. Since this is a rural area and roads are not well built, If a truck breaks down, then we need to separately send 4- 5 laborers and a 1-2 big vehicles along with drivers to reshift goods from that truck and finish the delivery. This issue might consume half a day apart from the loss of diesel, manpower and also creating frustration.

Yashvardhan: Thank you sir, this information is very useful for our project.

Summary:

Yashvardhan interviews Mohd Yusuf, a dispatcher responsible for assigning appropriate vehicles, drivers, labourers, and necessary resources to complete logistics orders on time and ensure delivery to the correct location.

Since all assignments are handled manually, he faces significant operational stress. One major issue is **resource miscalculation**, such as assigning a vehicle that is too small for the load. In a recent instance, this mistake caused a four-hour delay and required an additional vehicle to be sent to complete the job.

Large shifting services often take 4–5 hours, and tasks that seem quick may consume more time than expected. This results in **schedule delays** and frustration among customers, drivers, and the dispatcher.

Vehicle breakdowns in rural areas with poor road conditions create serious disruptions. In such cases, additional labourers and vehicles must be dispatched to transfer the goods and complete delivery. These incidents can consume half a day and lead to increased diesel costs, manpower strain, and customer dissatisfaction.

Overall, the dispatcher's challenges stem from **manual coordination, resource miscalculations, time overruns, and slow crisis handling during breakdowns.**
