

Master Specification: AI Customer Support (The "Amazon-Style" Bot)

Role Tier: External/Internal Interface

Primary Objective: To provide instant, 24/7 transparency to customers and reduce the manual workload for the human team.

1. Intelligent Order Tracking (The "Where is my stuff?" Module)

Instead of a static tracking page, the GenAI bot provides **contextual updates**.

- **Live Telematics Integration:** The bot pulls the **Driver's** current GPS and the **Dispatcher's** optimized ETA.
 - *Bot Response:* "Your driver, Carlos, is currently 2 miles away. He just finished a delivery at 5th Ave and should be at your door in approximately 8 minutes."
- **Visual Proof:** The bot can instantly fetch and display the **Proof of Delivery (PoD)** photo taken by the driver or the "Packed" photo from the **Warehouse Manager**.

2. Autonomous Problem Solving (The "Action" Module)

Like Amazon's bot, your system shouldn't just talk—it should **do**.

- **Address Correction:** If a customer realizes they entered the wrong house number, the GenAI bot can check the **Dispatcher's** route. If the driver hasn't reached that zone, the bot *automatically* updates the manifest.
- **Rescheduling:** The customer can say, "I won't be home until 5 PM." The bot checks the driver's schedule and moves the delivery to the end of the route without human intervention.
- **Refund/Return Initiation:** If a customer reports a damaged item, the bot starts a **Reverse Logistics** ticket, sends a return QR code, and notifies the **Warehouse Manager** to expect a return.

3. The "Human-in-the-Loop" Escalation

The AI knows when it's out of its depth.

- **Sentiment Analysis:** If the AI detects the customer is getting angry (based on word choice), it "hot-swaps" the conversation to a human **Logistics Manager**.
- **Internal Triage:** The bot can create internal "Tickets." For example, if a customer says their package smells like smoke, the bot sends a high-priority alert to the **Logistics Manager** to inspect that specific **Driver's** vehicle.

4. Generative AI Capabilities (The Tech Stack)

- **Natural Language Understanding (NLU):** Handles "human" typos and slang (e.g., "Wheres my pkg??" vs "Please provide the status of my shipment").
- **Multi-Lingual Support:** Automatically detects the customer's language and translates the logistics data into their native tongue.
- **Proactive Notifications:** Instead of waiting for a chat, the AI "pings" the customer if it sees a delay: *"Hi! I'm your AI assistant. I noticed your driver is stuck in heavy traffic. Your new ETA is 4:15 PM. Sorry for the wait!"*

How it Connects to Your Other 5 Roles:

Connection	Data Flow
CS ↔ Driver	The bot asks the driver's phone for "Current Location."
CS ↔ Warehouse	The bot checks if the item is "Still on the shelf" or "Loaded."
CS ↔ Dispatcher	The bot requests a "Route Re-calculation" if a customer changes their time.
CS ↔ Manager	The bot provides a "Daily Customer Sentiment Score."

Technical Requirement for the Team

To build this, your team will need:

1. **A Large Language Model (like Gemini)** to power the conversation.
2. **RAG (Retrieval-Augmented Generation):** This allows the AI to "look" at your private SQL database (Orders, Drivers, GPS) to answer questions accurately without "hallucinating."
